Support projection can destroy backward-error feasibility

Conjecture 00000005137

14 October 2026

Audit correction: research only. This is not a complete disproof of Conjecture 00000005137 and is excluded from the completed-solution count. The direct projection calculation remains correct, but does not exclude a normalized support-conversion formula.

Scope. We test the stated support-projection rule for matrix-only backward error in $Ax = b$, using the Frobenius norm and coordinate projection onto the nonzero positions of A. These choices are stated explicitly because the conjecture does not specify a norm or which input data can be perturbed.

Take

$$A = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}, \quad x = \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \quad b = \begin{pmatrix} 3 \\ 2 \end{pmatrix}, \quad r = b - Ax = \begin{pmatrix} 1 \\ 1 \end{pmatrix}.$$

The support $S = \{(1,1),(1,2),(2,2)\}$ is a tree in the bipartite row-column graph: its path is column 1, row 1, column 2, row 2. For $E = \left(\begin{smallmatrix} a & b' \\ c & d \end{smallmatrix}\right)$, the backward error constraint is

$$(A+E)x = b \quad \Longleftrightarrow \quad a + b' = 1, \quad c + d = 1.$$

Define

$$D = \begin{pmatrix} 1/2 & 1/2 \\ 1/2 & 1/2 \end{pmatrix}, \qquad T = \begin{pmatrix} 1/2 & 1/2 \\ 0 & 1 \end{pmatrix}.$$

Theorem 1. *D is the unique minimum-Frobenius-norm dense feasible perturbation, with $\|D\|_F^2 = 1$. The minimum supported perturbation is T, with $\|T\|_F^2 = 3/2$. The support projection of D is not feasible.*

Proof. For every feasible E,

$$\|E\|_F^2 = 1 + \tfrac{1}{2}(a - b')^2 + \tfrac{1}{2}(c - d)^2 \geq 1.$$

Equality requires $a = b'$ and $c = d$, so the row sums force all four entries to equal $1/2$. Under the support constraint $c = 0$, feasibility forces $d = 1$, and

$$\|E\|_F^2 = \tfrac{3}{2} + \tfrac{1}{2}(a - b')^2 \geq \tfrac{3}{2},$$

with equality at T. But

$$\Pi_S(D) = \begin{pmatrix} 1/2 & 1/2 \\ 0 & 1/2 \end{pmatrix}, \qquad \Pi_S(D)x = \begin{pmatrix} 1 \\ 1/2 \end{pmatrix} \neq r.$$

Therefore projection of the dense minimizer cannot give a sparse minimizer. There is also a strict discrepancy between the two optimal squared norms. □

Formal correspondence. `SparseBackward.lean` uses four real coordinates for an actual 2×2 matrix, explicit matrix-vector multiplication, and the actual equation $(A+E)x = b$. Its minimization predicates quantify over all four real entries of every competitor. The squared objective is the squared Frobenius norm, so it has exactly the same minimizers. Lean proves dense optimality, sparse optimality, uniqueness of the dense minimizer, and failure of feasibility after projection. In particular, `no_projected_dense_minimizer` excludes every dense minimizer, not just a selected feasible perturbation. `SupportTree.lean` proves Mathlib's connected-and-acyclic tree predicate for the four-vertex path. `support_correspondence` identifies its row-column adjacencies with the actual nonzero entries of A. `counterexample_with_tree` combines this verified tree support with the minimization counterexample.

Why this is not a disproof of the full conjecture. The problem does not specify its projection formula or normalization. In this same example, the support-aware row correction

$$N(E) = \begin{pmatrix} E_{11} & E_{12} \\ 0 & 2E_{22} \end{pmatrix} \quad \text{satisfies} \quad N(D) = T.$$

Thus a normalized projection recovers the true sparse minimum. Lean verifies both this equality and the minimum property. The existing calculation excludes only the raw coordinate projection. It cannot rule out the unspecified conversion in the official statement. No full-conjecture submission or completed-solution credit is claimed.

Reproduction and sources. Lean 4.19.0 and pinned Mathlib are specified in the project. The final axiom audit contains only `propext`, `Classical.choice`, and `Quot.sound`. The official bilingual text is included. For the distinction between structured and unstructured backward error, see D. J. Higham and N. J. Higham, Backward error and condition of structured linear systems (1992).
